

Workflow Audit

This audit maps my recurring workflows and identifies where AI can support my work while keeping ownership of important decisions.

Recurring task	AI classification	Rationale
Company research, contact discovery & cold outreach	Delegate to AI with review / Collaborate with AI	AI can speed up finding relevant companies and contacts, but I verify information, choose who to approach, and own the message strategy.
Coding and debugging	Collaborate with AI	AI helps accelerate development and troubleshooting, but I remain responsible for architecture, requirements, technical decisions, and code quality.
Job application preparation	Collaborate with AI	AI helps tailor CVs, cover letters, and responses, but I own the accuracy, positioning, and final voice.
Portfolio and side project development	Collaborate with AI	AI supports ideation, implementation, and debugging, while I decide the product direction and engineering approach.
Technical learning and studying	Just me	Deep understanding requires active learning and practice. AI can clarify concepts, but it should not replace the learning process.
Code review and pull request review	Collaborate with AI	AI can help identify issues and explain unfamiliar code, but I decide whether changes fit the project standards and requirements.
Project coordination and planning	Collaborate with AI	I define goals and constraints while AI helps improve planning, structure, and risk identification.

Recurring task	AI classification	Rationale
Writing project updates	Collaborate with AI	I provide the actual progress and context, while AI helps improve clarity, structure, and tone.
LinkedIn content creation	Collaborate with AI	I provide the experiences and ideas, while AI helps with ideation and refinement without replacing my voice.
Astrology readings and interpretation	Collaborate with AI	AI helps challenge assumptions and identify possible bias, while I own the interpretation and reasoning.
Reading and entertainment reviews	Just me	This is personal reflection and enjoyment where AI does not add meaningful value.
Journaling	Just me	I keep this as a personal reflection practice rather than outsourcing my thoughts to AI.
Apothecary and hands-on practical work	Just me	This depends on physical practice and personal research rather than AI assistance.
Language learning	Just me	I want to build understanding through my own study and practice, with AI only as optional support.

Target Tasks & Definition of Done

1. Cold Outreach: Company & Contact Search + Direct Outreach

(replaces traditional job search; AI role: hybrid, delegate discovery, collaborate on contact selection and messaging)

Done well means AI speeds up finding companies and contacts, while I own who to contact, what to ask, and how the message sounds.

Success criteria:

- Contact accuracy $\geq 90\%$, verified by me before sending
- Zero fabricated contact info. AI must flag inferred vs. confirmed
- 100% of messages reference something specific and true about the company/contact
- Response rate tracked over rolling 2-4 week windows as primary metric

I evaluate whether AI distinguishes verified from guessed information, and whether it pushes back on vague asks. I own contact verification, the specific ask, message voice, and outreach volume.

Key risks: AI presenting guessed contact info as confirmed; messages converging into templates at scale; vague, low-commitment phrasing that gets vague responses.

2. Coding and Debugging

(AI role: collaborate)

Done well means I reach correct, maintainable solutions with AI faster than alone, and can explain any kept solution without re-reading AI's explanation.

Success criteria:

- Explain-back rate = 100%, if I can't explain it, it doesn't ship
- Every bug fix includes a regression test, not just a patched symptom
- Track time-to-first-fix vs. time-to-correct-fix separately
- Monthly: re-solve a past problem without AI to check retained understanding

I evaluate whether AI reasons about my actual codebase or pattern-matches generically, and whether it surfaces trade-offs unprompted. I own root-cause confirmation, architectural decisions, and edge cases specific to my data/environment.

Key risks: accepting fixes I don't understand (understanding debt); stopping investigation once symptoms resolve; AI hallucinating deprecated APIs.

3. Job Application Preparation

(AI role: collaborate)

Done well means applications are accurate, tailored, and sound like me — faster than manual prep, without inflating my actual experience.

Success criteria:

- Zero fabrication, any invented claim triggers a full document re-read
- Every application references specific details from the posting, identifiable without the header
- Turnaround time decreases without a drop in tailoring quality
- Interview-to-application ratio tracked over time as a lagging signal

I evaluate whether AI's tailoring is substantive or cosmetic, and whether it pushes back when asked to overstate something. I own every factual claim, final voice/tone, and whether framing is fair, not just flattering.

Key risks: gradual exaggeration creep across drafts; homogenized phrasing across applications; AI's default register quietly replacing my own voice.
