

Portfolio Fix Log

Specific Issues and Targetted Fixes

1. Netlify badge overlay

Before:

The Powered by Netlify badge appeared fixed over the lower-right content on mobile.

Changed:

Disabled the Netlify badge/HUD injection.

After:

The portfolio content is no longer covered by a floating badge on mobile.

Verified:

Checked on mobile and desktop.

2. Agentic BI Builder demo GIF

Before:

The GIF was approximately 5 MB and PageSpeed identified it as the main image-delivery problem.

Changed:

Compressed the GIF by reducing [frame rate/colours/duplicate frames].

After:

The GIF remains animated and readable, but is now [new size].

Verified:

Checked on mobile and desktop.

3. Full Images not displaying

Before:

Images were being cut/zoomed when they did not fit the content dimensions. The background colour was also clashing with the visual flow of the website.

Changed:

Made the content fit the full images not cropping/zooming to fit size

After:

All images now fully visible and rendering correctly

Verified:

Checked on mobile and desktop

4. Link audit

Checked:

- Resume PDF
- Email link
- LinkedIn
- GitHub profile
- All five case studies
- Public project repositories
- StudyGapAI live demo

Result:

All links working and clickable

5. Phone audit

Confirmed the following during mobile phone check:

- Is there horizontal scrolling? **Yes**
- Does the header fit? **Yes**
- Can Projects, Resume, and Contact be tapped easily? **Yes**
- Does the headline fit without awkward clipping? **Yes**
- Does the portrait fit correctly? **Yes**
- Do project images stay inside their cards? **Yes**
- Are screenshots readable rather than blurry? **No**
- Does the resume PDF open? **Yes**
- Can you tap every project link? **Yes**
- Does the email link open the mail app? **Yes**

Appendix – PageSpeed & AI Audit analysis enhancements. Not required for this assignment.

Scoped for future work.

Mobile

Fix

1. Put the headline and introduction before the portrait.
2. Increase navigation link tap areas.
3. Defer GIF loading until the visitor chooses to play it.
4. Use smaller responsive portrait and project images.

What is already okay

- No obvious horizontal overflow
- Mobile viewport is configured correctly
- Text remains readable
- Navigation fits
- Images have descriptive alt text
- Mobile CLS is very low at 0.004

Readability

The PageSpeed accessibility score of 100 confirms the previous conclusion: there is no urgent contrast or text-size problem.

Keep

- Current dark text and green heading palette
- Current general spacing
- Current line-height
- Current alt text and page structure

Optional polish

- Limit long paragraphs to roughly 65ch
- Consider increasing normal body text from 16px to 17px
- Use a darker focus outline instead of the relatively subtle gold outline

For example:

CSS

```
.hero-copy p,  
.case-section p:last-child {  
  max-width: 65ch;  
}
```

```
a:focus-visible {  
  outline-color: var(--green-dark);  
}
```

These are polish items, not blockers.

Speed

The PageSpeed results change the speed recommendation slightly:

Do not remove the GIF

Instead:

1. Show a poster first.
2. Load the GIF on click.
3. Optimize the GIF itself.
4. Use poster images on project cards.
5. Add responsive versions of the portrait and project images.
6. Keep the hero portrait eager and add `fetchpriority="high"`.

The site has:

- 0 ms total blocking time
- No meaningful JavaScript execution problem
- A small DOM
- Very small CSS compared with the image payload

So there is no need for a framework rewrite or JavaScript cleanup.

Breaks and links

No confirmed broken internal routes or public repositories were found.

Still address these small issues

- Add the real StudyGapAI live-demo link to the case study.
- Label the SolarSense repository as archived, or replace it with an active repository.
- Make "Private repository — available on request" an email link for the private projects.
- Clarify that the Agentic BI item is a video preview if there is no interactive demo.

The resume PDF and public GitHub links are working. LinkedIn could not be automatically verified because LinkedIn returned a crawler 403, so it should be checked manually in a normal browser.

Final checklist

Do these first

1. Keep the GIFs, but load them only after the visitor chooses to play.
2. Create poster images for the GIFs.
3. Add responsive image sizes for the portrait and project images.
4. Add explicit image dimensions/aspect ratios.
5. Put the mobile hero copy before the portrait.
6. Increase mobile navigation tap targets.

Do these next

8. Make repeated case-study link labels specific.
9. Add the StudyGapAI live-demo link.
10. Self-host or reduce Google Fonts if mobile FCP is still slower than desired.
11. Tighten long paragraph widths and strengthen the focus outline.

You do not need to change

- The overall visual design
- The color palette
- The Astro/static architecture
- The JavaScript approach
- The current accessibility structure
- The general typography scale
- The project-card layout
