

Proof Statement (claim + person + action)

I build end-to-end AI systems that connect data, models, and usable interfaces, for early-stage founders who need a working product they can make decisions with. If you have a real problem you want to turn into a working AI system, email me about a scoped project or build sprint and let's see what I can deliver.

One-line why

A CV records my experience but this portfolio proves why it matters to the right person and what they can do about it.

Previous Proof Statement – before Survive the Crit Peer Review

I build applied AI systems around real problems, starting with what actually needs to be solved rather than the technology. I want to show an early-stage founder or technical leader that I can take a problem from understanding what it needs to do, through the technical decisions, to a working system. The goal is simple: give me a real, scoped problem for a short trial project or build sprint and judge me on what I deliver.
