

Portfolio One-Line Claim & Content Map

1. One-line claim

I build AI systems that connect data, models, and interfaces into working systems.

This is the central claim the portfolio needs to prove: I can take a problem that needs solving and produce a useful working system around it.

Previous version (pre-portfolio peer-review):

Useful working systems, built around what actually needs to happen.

2. Content Map

Home

Sections in order

1. Positioning / one-line claim

- Establish the claim quickly.
- Brief positioning statement explaining how I think about building useful systems.

2. Selected work

- **Agentic BI Builder** — lead case
- **Financial Risk Monitor** — second case

3. Trial-project CTA

- Introduce the short build-sprint proposition.

CTA

Give me one problem you'd like solved by next week.

Give me one scoped problem. I'll spend a week building a solution and you can decide if you want me on the team.

Projects

Sections in order

Each case follows the same three-part structure:

The problem → What I did and decided → What came of it

Projects are ordered by the strength of the evidence they provide for the claim.

1. Agentic BI Builder

Lead case.

Demonstrates the strongest evidence that I can take a business workflow and turn it into a useful working system.

The case focuses on deterministic data profiling, LLM-based KPI inference constrained by a schema, reflection to catch unsuitable proposals, and the PBIR compiler that produces an output Power BI Desktop can open directly.

2. Financial Risk Monitor

Demonstrates a complete working analytical system combining financial and macroeconomic data, quantitative risk analysis, forecasting, Monte Carlo simulation, and an interactive Power BI dashboard.

The case also shows technical decisions made according to the actual requirements of the system, including using SQLite because concurrent writes were not the constraint and Monte Carlo simulation because the system needed scenario analysis.

3. SolarSense

Demonstrates an applied ML system built around a real business workflow, reducing a solar viability assessment from approximately 1–3 weeks to about 3 minutes.

The portfolio case will focus on the **ML models and microservice architecture**, rather than the frontend product.

The architecture and workflow visuals can be created specifically for the portfolio. They should represent the actual system and should not be presented as screenshots of the application.

4. StudyGapAI

Demonstrates an end-to-end educational system that diagnoses the underlying gap behind an incorrect answer and builds a study plan around that gap.

The original backend deployment is no longer available, and I did not retain a demo recording or generated reports. Until the system is redeployed, no claim of current live backend functionality should be made.

No measured educational improvement should be claimed because I do not currently have outcome data.

5. Alzheimer's Disease Classification

Demonstrates disciplined ML experimentation and model evaluation rather than a deployed system.

The case will focus on the comparison of **DenseNet, ResNet, and EfficientNet**, the model-selection process, and the discovery and rejection of data leakage.

The corrected performance result should not be presented until the clean rerun is finished.

Resume

Sections in order

1. Resume link

No additional portfolio narrative is required.

CTA

View my resume →

The resume is a secondary credibility path for visitors who want the formal record after reviewing the portfolio.

Contact

Sections in order

1. **Trial-project proposition**
 - Repeat the short build-sprint proposition.
2. **Primary contact**
 - Email
3. **Secondary links**
 - LinkedIn
 - GitHub

CTA

Give me one problem you'd like solved by next week.

The primary action is **Email me**.

CTA Ladder

The portfolio has one primary action:

Start a short trial project / build sprint.

The pages support that action progressively:

- **Home:** Understand the claim → see the strongest evidence → **contact me about a problem**
- **Projects:** Examine the evidence in depth → **contact me about a problem**
- **Resume:** Verify my background → continue toward contacting me
- **Contact:** Remove the final friction → **email me about a problem**

The Resume CTA is a supporting action, not a competing conversion goal.

Final Gather List

Essential before build week

- Agentic BI Builder demo GIF
- Financial Risk Monitor dashboard screenshot
- SolarSense ML microservice architecture visual
- SolarSense before/after workflow visual (optional)
- SolarSense live demo link
- SolarSense repository link
- StudyGapAI before/after workflow visual
- StudyGapAI repository link
- Alzheimer's three-model architecture comparison visual
- Alzheimer's data-leakage visual/evidence
- Alzheimer's repository link

- Final resume
- Email, LinkedIn, and GitHub links

Evidence that must remain explicitly unfinished

- **Alzheimer's:** corrected model performance — do not present a final number until the clean rerun is complete
- **StudyGapAI:** educational outcome improvement — no measured improvement should be claimed without evidence

Any AI-generated or designed visual used where an original asset does not exist should represent the actual system or workflow accurately. It should not be presented as empirical evidence, a screenshot, or a result that was never captured.
